

Environmental policy

FireSeal AB is a Swedish company engaged in trade and product development of fire sealing products for construction, industrial, marine and offshore customers. As part of the Bergman & Beving Group, we adhere to and take part in the policies and guidelines adopted by the Group.

The environmental perspective shall be included in important decisions, with the aim of creating long-term value for our owners, customers, employees and for the whole of society. Hence, the environmental aspects shall be considered within our strategic business development, be well integrated into the operational work and seen as an ever-ongoing improvement process. Through high level of expertise of our employees and by constantly developing our knowledge about the environmental impact, we can have a holistic view of the total footprint FireSeal's operations have on the environment. Measures to decrease the environmental footprint shall be taken as far as it is technically possible and commercially reasonable.

FireSeal's ambitions in the environmental area are:

- Increase the proportion of environmentally assessed products and improve our products' rating in environmental assessments.
- Environmental impact must be taken into account throughout the life cycle of the products and services we provide.
- Introduce products that contribute to a more sustainable, environmentally friendly and safe fire sealing.
- Increase the understanding of sustainable work among our own staff and subcontractors.
- Reduce our total carbon emissions in relation to the number of products we put on the market.
- Circular thinking and recycling of materials in our own operation.
- Legislation is a minimum requirement and, together with internal and other external requirements, contributes to our development.
- Ideally, we want our subcontractors to be environmentally certified.

Fireseal's environmental policy is normally established by the company's management team once a year.
